The screenshot displays the RUBY RED web interface for Node-RED. The main workspace shows a flow named "Flow 1" with the following nodes and connections:

- Start node: `set msg.filename`
- Series of `inject` nodes connected to:
 - `GetAllMachines` (with error: "Invalid properties: -GetAuthentication")
 - `GetMachinesCount`
 - `GetMachines`
 - `GetMachineProductionStatus`
 - `GetMachineConnectionStatus`
 - `GetMachineLatestJob`
 - `GetMachineLatestProducedMaterialLot`
 - `GetMachineLiveSpeed`
- Each API node is connected to a `msg.payload` node.

The interface includes a left sidebar with node categories (common, function), a top browser window showing the URL `localhost:1880/#flow/f5ef0831.4734e8`, and a right sidebar with an "info" panel showing flow details and a "Flow 1" panel with the flow ID `"f5ef0831.4734e8"`.
